

The solubility of Tylogran® 1000 mg/g in drinking water

Tylosin dissolves well in drinking water. As a result, no water conditioners are needed to dissolve Tylogran® 1000 mg/g.

The rate at which tylosin dissolves does however depend on several factors. To dissolve Tylogran® 1000 mg/g quickly in drinking water it is recommended to use warm water, with a temperature of approximately 40 °C. Because tylosin is very thermostable this will not negatively influence the effectivity of the product.

Stirring is also advised to quickly dissolve the product.

A drinking water solution with Tylogran® 1000 mg/g can be stored for a period of 24 hours. The medicated drinking water should be refreshed after this period.
